用干电源上电控制的MCU电源 VCC5.0 U17 522UE/63V VDD MCU 1 Vin Vout 2 C63 C64 C65 C66 Vcc GND 104 104 104 内核电源,最大12A电流 主供电口,这个接口请链接我们的电源 DCM SHELL 4 SHELL 5 SHELL 6 SHELL DDR3电源芯片 GND | 1 2 DC ENIV8 DDR3_VTT GND | 1 2 DC EN1V5 MP2145 GND | 1 2 DC EN3V3 高速收发器电源 VIN VIN VCC5.0 GND | 1 2 DC EN2V5 5 2.5V/3.3V可调 C214 104 C2 6 MODE SSS RAMP 4 2 1 20PF R73 R74 44.2K 63.21 高速收发器电源 PCIE插槽12V转5V电源 VOT-4 89 7 PG FB 3 1 1 20PF (c) MODE S S S RAMP (c) MP2/45 S T RAMP C237 104 C237 C237 C237

第二部分 电源引脚

第三部分 电源上电MCU控制器

用于控制电源芯片上电顺序的ARM芯片

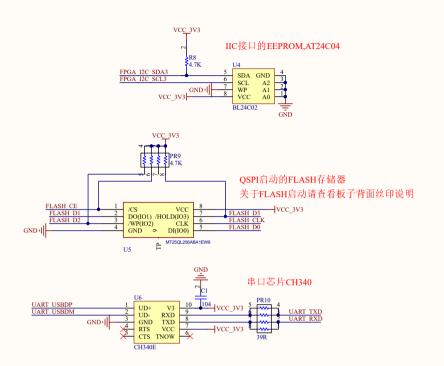

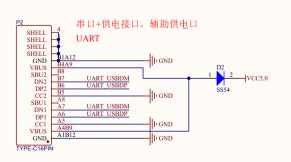

长按给FPGA各路电源上电按钮 MCU状态输出指示灯

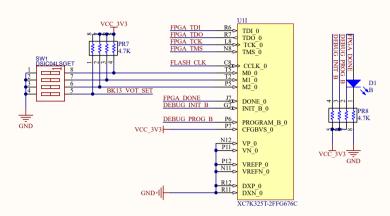

第四部分下载器和JTAG\EEPROM\串口\FLASH

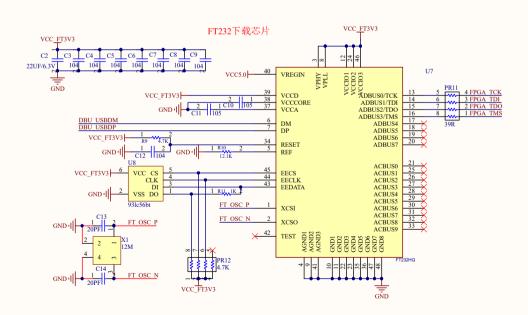

KINTEX-7芯片的调试接口部分

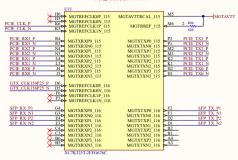

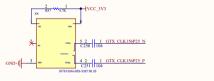

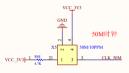

第五部分 芯片的BANK

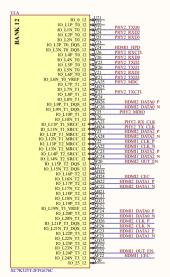

高速收发器BANK

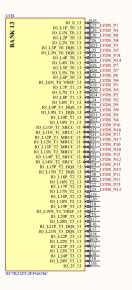

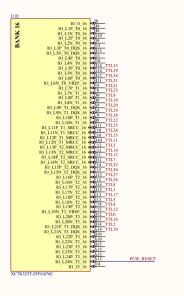

GTX参考时钟, 156.25Mhz支持万兆以太网, R5版这个晶振都是156.25M频率

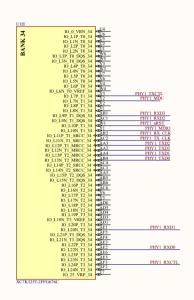

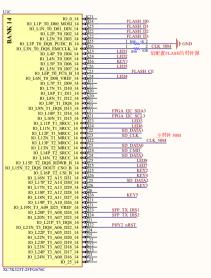

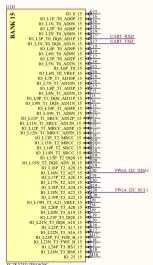

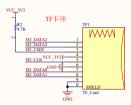

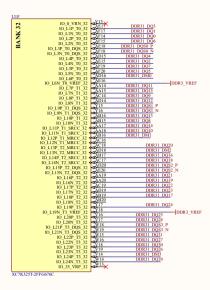

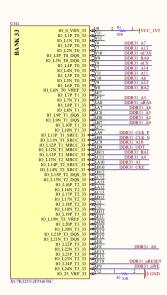

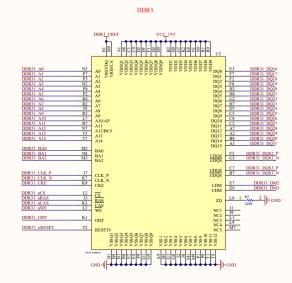

第六部分 DDR3和SD电路

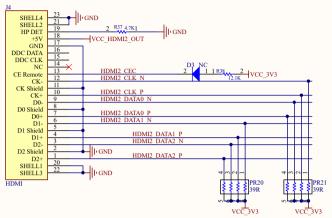

DDR3

第七部分 HDMI电路

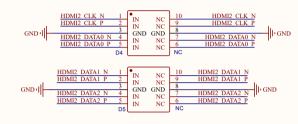

HDMI接口都是3.3V的TMDS电平标准

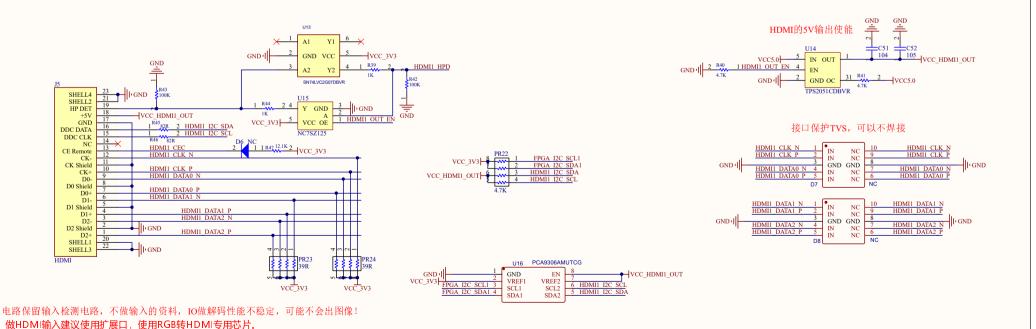

仅输出,最大1080P@30HZ,60HZ时钟超范围但可以使用,不推荐

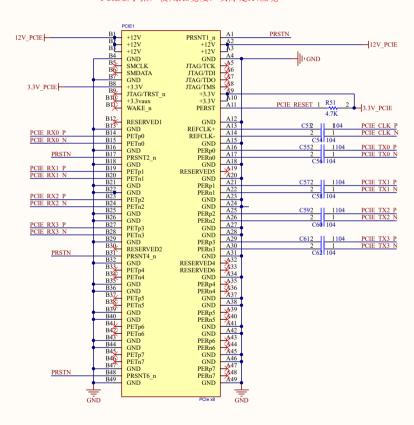

接口保护TVS, 可以不焊接

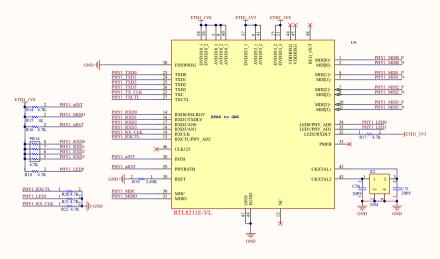

第八部分 PCIE接口电路

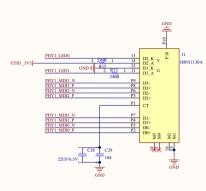

PCIE金手指,使用X8宽度,实际是X4位宽

第九部分 干兆以太网电路

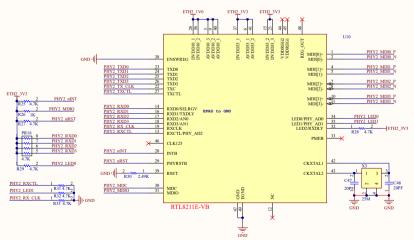

1.8V电平标准IO的千兆网PHY芯片

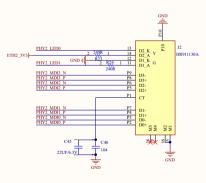

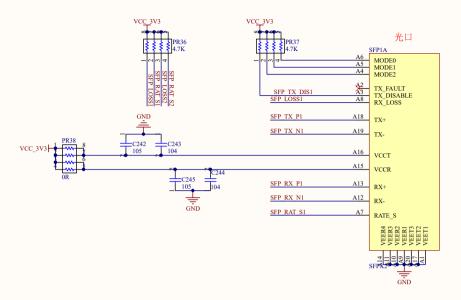

3.3V电平标准的千兆网PHY芯片

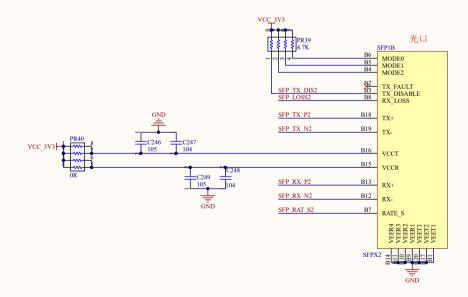

3.3V供电IO实际也可以使用VL后缀,实际需要调RGMII的IO Delay

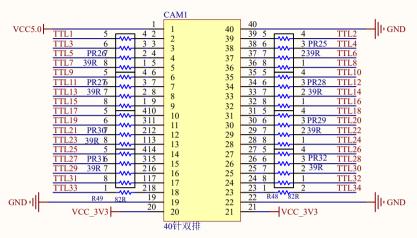

第十部分 万兆SFP+电路

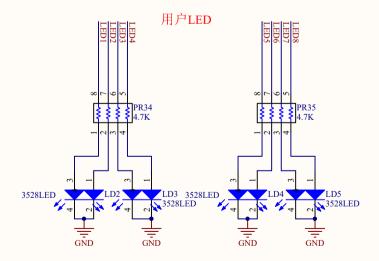

第十一部分 扩展GPIO和按钮\LED电路

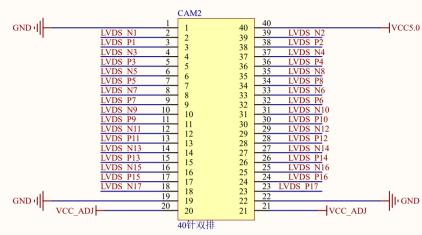

BANK16扩展出来的3.3V标准IO

此部分为了保护10,加了保护电阻,均为单端,未做等长处理,适合低速0

BANK13扩展出来的2.5/3.3V可调IO, 支持LVDS(仅2.5V电压的时候)

此部分全部做了等长,LVDS成对做了差分,适合速率高的差分,也可以做单端信号

用户按钮
